

PRIVATE & CONFIDENTIAL

Legacy Twin

Business Plan and Product Roadmap

A consent-first platform for preserving a person's stories, voice, values, and permissions across generations.

Prepared	August 3, 2026
Status	Working plan
Working name	Legacy Twin (descriptive only)

This document contains strategic, commercial, product, and financial planning assumptions. It is not legal, clinical, tax, or investment advice.

Contents

Contents

1. Executive decision

This plan is commercial and product strategy, not legal, clinical, tax, or investment advice. Specialist counsel is required before collecting identity, biometric, health, estate, or postmortem data.

1. Executive decision

Build a **consent-first interactive legacy archive**, not a product marketed as bringing the dead back to life.

The customer records stories, memories, relationships, values, expressions, and voice while alive. The platform turns that first-party material into a private, source-grounded conversational representation. When death or permanent incapacity is verified, the representation becomes a frozen **Memorial Mode** governed by the person's prior instructions and the independent consent of every family member who chooses to interact with it.

The emotional promise is:

Preserve their stories, voice, wisdom, and way of speaking-so future generations can know them in their own words.

The company must never claim that consciousness survives, that the representation is the person, or that interaction is grief therapy. It should optimize for **fidelity, provenance, agency, and continuity**, not engagement time.

Why this can win

- The technical ingredients-conversational models, retrieval, voice synthesis, and avatars-are becoming commodities.
- The durable advantage is a verified personal memory graph, years of first-party recordings, explicit permissions, family governance, behavioral evaluation, security, and a credible continuity plan.
- Existing products show both demand and fragility. HereAfter AI currently says it is shutting down, while StoryFile Life is waitlisted; this makes portability and long-term stewardship a market requirement, not a back-office feature ([HereAfter](#), [StoryFile Life](#)).
- U.S. demographics support a large category: 18% of the 2025 population is 65 or older, approximately 61.5 million people, and 3.07 million U.S. resident deaths were registered in 2024 ([U.S. Census](#), [CDC](#)).

2. Problem and customer insight

Problems being solved

- 1 Important stories disappear because families postpone recording them.
- 2 Photos, voice notes, documents, and videos are fragmented across devices and accounts.
- 3 Static books and archives require a descendant to know what to search for.
- 4 General-purpose AI can imitate a person but lacks consent, provenance, family governance, and reliable boundaries.
- 5 Families do not trust a young startup to preserve emotionally irreplaceable material for decades.

Primary customer

The initial buyer is an adult child aged roughly 35-60 who wants to preserve a parent's or grandparent's story. The subject is typically 60-85, comfortable speaking but may not be technically confident. This creates a gift-driven, two-sided onboarding flow: the buyer starts the project, but the subject must personally consent and participate.

Secondary customers

- Self-directed legacy builders aged 50+

- Families facing a serious diagnosis, served through a high-touch concierge channel
 - Founders, community leaders, educators, veterans, and cultural custodians with a body of knowledge to preserve
 - Estate-planning firms, senior communities, insurers, hospice and palliative-care organizations, and funeral homes as carefully selected distribution partners
- The product should not initially target recently bereaved consumers who lack prior consent from the deceased. Retrospective reconstruction from scraped messages is strategically and ethically out of scope.

3. Product definition

Core lifecycle

Stage	Customer experience	System behavior
Consent	Subject verifies identity and selects permissions	Creates a signed, versioned consent record for text, voice, visual likeness, users, purposes, and successors
Capture	Guided interviews, uploads, family-submitted questions	Transcribes, indexes, and separates first-party memories from third-party annotations
Review	Subject corrects facts, names, dates, pronunciations, and sensitive topics	Builds a verified memory graph and confidence score
Living Mode	Subject and invited family can ask questions and improve coverage	Answers from approved sources; subject can edit, revoke, export, or delete
Freeze	Death or incapacity is verified using the chosen protocol	Stops personality evolution and prevents the system from learning from descendants
Memorial Mode	Opted-in adults can privately converse or browse stories	Clearly labeled simulation; no autonomous outreach; every factual answer links to its source
Retirement	Steward or interactant chooses to stop	Supports export, individual opt-out, and respectful archive or deletion workflows

MVP features

- Identity and liveness verification for the person being represented
- Granular consent dashboard
- AI-guided audio interview with 100-200 prompts across life domains
- Uploads for photos, documents, voice, video, and written memories
- Transcription and a subject-approved fact, relationship, and event graph
- Text conversation limited to verified sources
- Original-recording playback alongside generated summaries
- "I don't know / I never recorded that" behavior
- Family questions and invitations, each requiring opt-in
- Access controls, audit history, export, deletion, and successor designation
- A private beta voice, only after the subject approves its similarity and permitted use

Explicitly excluded from MVP

- Photorealistic live face/avatar

- Clones created without first-party consent
- Children interacting with a generative memorial persona
- Public social-media accounts for a deceased representation
- Outbound messages written by the AI in the deceased person's voice
- Financial transactions, voting, contracts, endorsements, passwords, legal/medical advice, or identity authentication
- Advertising, product placement, or sale of profile data
- Claims of consciousness, immortality, or therapeutic efficacy

4. Product moat

The moat is not the base model. It consists of:

- 1 **First-party memory corpus:** high-quality, longitudinal, permissioned recordings.
- 2 **Verified memory graph:** people, events, dates, places, values, preferences, quotations, and relationships confirmed by the subject.
- 3 **Persona evaluation suite:** tests for factual grounding, linguistic similarity, boundary compliance, temporal awareness, and emotional tone.
- 4 **Consent and estate protocol:** versioned permissions that survive the transition from living to memorial use.
- 5 **Family governance:** roles, conflicts, opt-ins, opt-outs, annotations, and retirement.
- 6 **Continuity architecture:** open export, vendor portability, code/data escrow, and funded long-term storage.
- 7 **Trust brand:** no ads, no training shared models on customer data, no nonconsensual reconstruction, and no engagement manipulation.

5. Market and competition

Bottom-up market sizing

Avoid relying on speculative "digital immortality" market reports. Use transparent assumptions.

- **TAM reference:** 61.5 million U.S. adults aged 65+ x \$240 annual core subscription = approximately **\$14.8 billion annual theoretical spend**, before onboarding. This is a ceiling, not a forecast.
- **Initial SAM:** assume 20% of that population is reachable, digitally supported, and financially suitable: 12.3 million profiles x \$240 = approximately **\$3.0 billion annual recurring opportunity**, plus setup services. The 20% is a planning assumption to validate.
- **Five-year SOM:** 62,700 active paid profiles under the base case, or about 0.1% of the U.S. 65+ population, producing approximately \$10.4 million recurring revenue plus new-profile onboarding in Year 5.

The surrounding death-care market proves households already allocate meaningful budgets to remembrance. NFDA reports median 2023 funeral costs of \$8,300 with burial and \$6,280 with cremation; it also reports that nearly 30% of families completed arrangements online in its 2025 survey ([NFDA statistics](#), [NFDA 2025 consumer study](#)). This does not prove demand for an AI legacy, but it supports willingness to pay for personalized memorial services and hybrid digital/human guidance.

Competitive map

Category	Examples	Strength	Gap Legacy Twin should own
Interactive recorded video	StoryFile	Authentic recorded responses; no invented answers	Limited generative breadth; consumer onboarding currently waitlisted
Guided audio archive	HereAfter AI	Simple prompts and the real voice	Business is shutting down; continuity risk is visible
General AI avatars	2wai, MindBank AI	Fast visual or expert twins	Broader positioning; weaker memorial-specific governance and provenance
Emerging legacy clones	ETERNA, Eterna, Eternos-style services	Text/voice/video ambition	Trust, longevity, evidence, and consent standards vary
Static legacy products	Story books, genealogy, memorial pages	Familiar, low-risk, giftable	Not conversational and often difficult to explore
DIY general AI	General chat, voice, and avatar APIs	Cheap and flexible	No durable consent, estate control, source truth, or continuity

StoryFile says its AI locates the best prerecorded answer instead of inventing one, establishing authenticity as an important category benchmark ([StoryFile FAQ](#)). ETERNA advertises \$14/month text clones and \$29/month voice/video, showing a low-price self-service anchor, while high-touch legacy work can command much more ([ETERNA](#)). Legacy Twin should sit above low-cost self-service products through verification, governance, and human-supported capture.

6. Business model and pricing

Recommended pricing architecture

Offer	Price hypothesis	Included
Sampler	Free	Five stories, original audio, limited family preview, export
Core Legacy	\$299 activation + \$240/year	Guided capture, private archive, text, approved voice, 60 voice minutes/month, 10 family seats
Concierge Legacy	\$1,499-\$2,499 activation + \$360/year	Human interviewer, editing, archive digitization, relationship mapping, priority review
Visual Presence add-on	Phase 3; credit-based or \$49+/month	Controlled avatar minutes; never unlimited at launch
Continuity term	Test only after real usage data	Annual memorial plan first; later 10- and 25-year prepaid plans backed by a restricted reserve

Do not sell "lifetime" hosting. A startup cannot honestly guarantee forever. Publish a continuity policy that defines a contractual term, data export, insolvency handling, and the amount placed into a restricted continuity reserve.

Core unit-economics target

Illustrative per Core customer:

- First-year revenue: \$299 activation + \$240 annual plan = **\$539**
- Activation cost target: **\$60** for processing, review, support, and payment fees
- Annual variable cost target: **\$72**, assuming moderate voice use, model calls, storage, support, and security operations
- First-year gross profit before acquisition: **\$407**, or 75%
- Blended CAC ceiling: **\$150-\$200**
- First-year contribution after \$175 CAC: **\$232**

Current voice-agent pricing demonstrates why usage caps matter: ElevenLabs lists speech-agent pricing at about \$0.08 per minute before the full cost of orchestration, support, and infrastructure ([ElevenLabs API pricing](#)). The product should include a humane monthly allowance and offer neutral minute packs without emotionally coercive "keep them alive" messaging.

7. Go-to-market strategy

Positioning

Lead with legacy, stories, and family connection. Do not lead with death, resurrection, "ghostbots," or technical cloning.

Three messages to test:

- 1 **For adult children:** "Ask the questions you'll wish you had asked."
- 2 **For legacy builders:** "Pass down your stories in your own voice."
- 3 **For families:** "A private family archive future generations can explore through conversation."

Acquisition sequence

Phase 1 - Founder-led direct sales

- 50 qualitative interviews: 20 legacy builders, 20 adult-child buyers, 10 professionals
- Ten paid concierge prototypes before building a full avatar
- Gift occasions: milestone birthdays, retirement, anniversaries, Mother's/Father's Day, grandchild birth
- Educational content featuring family questions, oral-history capture, and digital-estate preparation
- Referral loop: each subject invites two family members to submit questions

Phase 2 - Trusted professional channels

- Estate planners and elder-law attorneys first: they reach people while alive and can normalize consent and successor planning
- Senior communities and retirement organizations
- Life insurers and wealth managers as a non-financial family-legacy benefit
- Palliative-care and hospice pilots only with independent ethics/clinical review and no therapeutic claims
- Funeral homes mainly as a memorial-access and referral channel for customers whose archive already exists; never as a source of nonconsensual clones

Phase 3 - Scaled B2B2C

- Partner portal, co-branded onboarding, permission templates, and revenue share
- Target 15-20% partner commission on activation revenue
- API or white-label only after consent, audit, and output-labeling controls are technically enforceable

Channel targets

- Landing-page lead to interview: 10%+
- Interview to paid deposit: 25%+
- Paid subject completing 20 stories in 30 days: 70%+
- Subject inviting at least two relatives: 60%+
- Activated paid referral rate: 20%+
- Blended CAC by Year 3: below \$175

- CAC payback: below 12 months

8. Technology and data architecture

Architecture

- 1 **Consent ledger:** identity proof, liveness, modalities, purposes, recipients, successors, expiry, and revocation.
- 2 **Encrypted media vault:** per-profile encryption keys, regional storage, immutable raw files, checksum verification, and lifecycle tiers.
- 3 **Processing pipeline:** transcription, speaker separation, entity/event extraction, sensitive-data classification, and subject review.
- 4 **Memory graph:** verified facts, relationships, timelines, values, preferences, stories, and linked source spans.
- 5 **Response engine:** retrieval first, policy check, answer generation, factual citation, confidence threshold, and refusal or "not recorded."
- 6 **Style layer:** vocabulary, cadence, humor, formality, and pronunciation derived only from approved first-party samples.
- 7 **Voice layer:** generated speech restricted to in-product, policy-compliant responses; no arbitrary text box or downloadable voice generator.
- 8 **Memorial control plane:** death/incapacity verification, freeze, steward roles, recipient opt-in, disputes, audit, export, and retirement.
- 9 **Evaluation and monitoring:** regression tests, adversarial testing, provenance checks, safety events, and model/version logs.

Non-negotiable technical rules

- Every factual claim must be linked to an approved source or explicitly marked as inference.
- High-stakes factual domains require direct quotation/playback or refusal.
- New family material after death becomes a labeled annotation and never silently changes the represented person.
- The persona says it is an AI representation when asked and never claims awareness, embodiment, or an upcoming physical meeting.
- No cross-customer model training by default; any research use requires separate, revocable consent.
- Synthetic audio/video is visibly labeled and machine-readable where feasible.
- Downloaded synthetic media is watermarked; arbitrary voice generation and telephone calling are prohibited.
- Customers receive raw media, transcripts, structured metadata, permissions, and a human-readable archive export.

9. Trust, safety, and ethical operating system

Peer-reviewed research recommends meaningful transparency, adult-only access, mutual consent for both the represented person and the interactant, opt-out rights, and respectful retirement procedures ([Hollanek and Nowaczyk-Basińska, 2024](#)). Other recent work warns that deathbot interactions can be emotionally unpredictable and may fabricate troubling memories ([Memory, Mind & Media, 2025](#)).

Product constitution

- Consent from the represented person is mandatory and independently verifiable.
- Consent from each interactant is also mandatory; no unsolicited notifications "from" the deceased.

- Interactive Memorial Mode is 18+ during the initial years. Original recordings can be shared with minors under family control, but not a generative persona.
- No advertising or recommendations inside conversations.
- No streaks, guilt messages, variable rewards, or engagement optimization.
- No prompts that discourage human relationships or professional support.
- Users can pause, hide, export, or retire access without contacting support.
- A safety and ethics council reviews product changes, incidents, and research.
- The company publishes an annual transparency report covering requests, incidents, deletion, model changes, and continuity funding.

Clinical boundary

The product is remembrance technology, not therapy. Hire grief and palliative-care advisors, but do not claim treatment or improved bereavement outcomes without clinical evidence and the appropriate regulatory pathway. Create an escalation flow for self-harm, delusional confusion, coercion, abuse, or severe distress, while collecting the least possible sensitive data.

10. Legal and regulatory plan

Privacy and biometrics

- GDPR excludes deceased persons at the EU level, but member states may create their own rules; while alive, voiceprints, face models, health information, beliefs, and inferred personality can trigger special-category and high-risk processing obligations. Treat all personal memory data as highly sensitive regardless of technical classification ([GDPR](#)).
- California treats biometric information used to identify a person as sensitive personal information under the CCPA ([CCPA FAQ](#)).
- Illinois BIPA expressly includes voiceprints and face geometry and requires written notice, release, retention rules, and destruction processes ([Illinois BIPA](#)). Texas also requires notice and consent before commercial capture of a voiceprint or face geometry and imposes disclosure, security, and destruction duties ([Texas Attorney General](#)).
- Israel's Privacy Protection Law Amendment 13 broadly covers identifiable personal information and treats some biometric identifiers and professional/personality assessments as specially sensitive ([Israel Privacy Protection Authority](#)). An Israel-based controller still needs cross-border, processor, security, notice, and data-subject-rights analysis.

Synthetic likeness and disclosure

- The EU AI Act requires people to be informed when interacting with AI and requires labeling of synthetic outputs and disclosure of deepfakes in covered cases ([EU AI Act, Article 50](#)).
- California AB 1836 expanded liability for certain unauthorized digital replicas of deceased personalities, reinforcing the need for documented prior consent and rights-chain review ([California AB 1836](#)).
- Tennessee's ELVIS Act adds voice to protected name/image/likeness rights and addresses unauthorized replica tools ([Tennessee HB 2091](#)).
- The federal NO FAKES Act of 2025 remains introduced, not enacted, as of this plan's date. Design as if a transferable postmortem digital-replica right and notice/takedown system will become the baseline ([Congress.gov](#)).

Required legal work before beta

- Jurisdiction matrix for privacy, biometrics, publicity rights, probate, consumer protection, minors, and AI disclosure
- Separate, plain-language consent for capture, generation, family access, research, successor control, and postmortem use
- Data protection impact assessment and vendor/subprocessor inventory
- Death/incapacity verification and family-dispute procedure

- Rights review for third-party messages, photos, recordings, music, and confidential stories
- Terms that guarantee export and prohibit deceptive, commercial, defamatory, fraudulent, sexual, or political use
- Cyber, media liability, errors and omissions, and directors/officers insurance
- Incident response, breach notice, law-enforcement request, and takedown procedures

11. Product and company roadmap

Phase 0 - Discovery and constitution, weeks 0-6

Build

- 50 customer interviews and 15 professional interviews
- Three message/price landing pages
- Consent charter, prohibited-use policy, first legal memo, and threat model
- Concierge demo using only original clips and a source-grounded text prototype

Gate

- At least 15 paid deposits or signed pilot commitments
- At least 30% of interviewed target buyers describe the problem as urgent
- No unresolved legal objection to first-party, adult, private beta use

Phase 1 - Concierge prototype, months 2-4

Build

- Recording workflow, transcription, manual fact review, memory graph, text conversation, source links, original audio playback, and export
- 25-50 profiles with founder-led onboarding
- Baseline persona and hallucination evaluation set

Gate

- 70% complete at least 20 stories within 30 days
- 80% say they would trust the archive with family
- 98%+ factual responses trace to approved evidence or correctly refuse
- Zero severe consent, impersonation, or emotional-safety incidents

Phase 2 - Private paid beta, months 5-9

Build

- Subject-approved voice, granular sharing, family questions, payments, audit logs, successor roles, pause/retire flow, and death-verification pilot
- Security review, penetration test, and SOC 2 readiness
- 100-300 paid profiles

Gate

- 60% invite two or more family members

- 50% reach 50 verified memories
- Family question answer coverage above 70%
- Paid conversion above 25% from qualified demos
- Blended first-year gross margin above 55%

Phase 3 - U.S. launch, months 10-15

Build

- Self-service gift flow, mobile-friendly recording, partner portal beta, Memorial Mode, liveness/consent automation, abuse monitoring, and support playbooks
- SOC 2 Type I target
- 20 estate-planning/senior-community pilot partners
- 250 cumulative new paid profiles in Year 1 base case

Gate

- CAC below \$250 and trending below \$175
- First-year contribution margin positive
- Critical hallucination rate below 0.5% in controlled evaluation
- Support burden below 90 minutes per Core activation

Phase 4 - Repeatable distribution, months 16-24

Build

- Mobile apps, multilingual capture, partner billing, family collaboration, advanced provenance, regional hosting, and SOC 2 Type II
- Limited visual-avatar research with living subjects and explicit separate consent
- 1,500 new paid profiles in Year 2 base case

Gate

- 75%+ annual paid retention when first cohort matures
- Partner-sourced acquisition at least 35%
- LTV/CAC above 3x using observed, not assumed, retention
- No public-launch visual product unless it improves trust in blinded tests

Years 3-5

- Year 3: 6,000 new profiles; scale partner network; launch continuity reserve and fixed-term plans; first regional expansion
- Year 4: 18,000 new profiles; carefully launch visual presence if validated; break-even target
- Year 5: 42,000 new profiles; approximately 62,700 active profiles; standardized export/escrow ecosystem; selective enterprise and cultural-institution products

12. Operating plan

Initial team, 7-9 full-time roles

- CEO / customer discovery / partnerships / fundraising

- CTO / security and architecture
- Product lead or design engineer
- Two full-stack engineers
- Applied AI/ML engineer focused on retrieval and evaluation
- Trust, privacy, and safety lead
- Story producer/customer success lead
- Part-time legal, security, grief, palliative-care, and estate advisors

Do not hire a large model-training team. Use replaceable model vendors behind an abstraction layer and invest internal engineering in evaluation, provenance, consent, security, and orchestration.

Governance

- Board-level trust and continuity committee
- Independent ethics/safety council with grief, palliative-care, disability, religious/cultural, privacy, and security expertise
- No single family steward can secretly alter the persona
- Quarterly incident and continuity-reserve review
- Model changes require regression tests against archived personas

13. Five-year financial base case

All figures are planning assumptions in USD millions, not forecasts. Setup revenue averages \$390 because a minority of customers buy concierge service. Subscription ARPU is \$240. Annual profile retention is assumed at 85% for the model and must be replaced with observed data. Gross margin improves with automation and vendor pricing.

Year	New paid profiles	Ending active	Revenue	Gross margin	Gross profit	Operating expense	EBITDA
1	250	250	\$0.13M	60%	\$0.08M	\$1.20M	-\$1.12M
2	1,500	1,713	\$0.82M	65%	\$0.53M	\$2.20M	-\$1.67M
3	6,000	7,456	\$3.44M	70%	\$2.41M	\$4.40M	-\$1.99M
4	18,000	24,337	\$10.84M	73%	\$7.91M	\$7.80M	\$0.11M
5	42,000	62,687	\$26.82M	75%	\$20.12M	\$13.50M	\$6.62M

Funding plan

- **Pre-seed: \$1.5-\$2.0M for 15-18 months.** Fund the constitution, legal architecture, prototype, 250 paid profiles, security baseline, and repeatable onboarding.
- **Seed: \$4-\$6M after evidence of trust and willingness to pay.** Fund productization, partnerships, security certification, multilingual work, and growth through Year 3.
- Base-case cumulative EBITDA loss before break-even is about \$4.7M; target total capital of \$6-\$8M to provide working-capital and execution buffer.

Do not raise a large round solely to build a photorealistic avatar. Raise against evidence that families capture, trust, pay, invite, renew, and recommend.

14. Metrics and decision system

North-star metric

Verified Legacy Coverage: the share of important life domains and family questions supported by subject-approved first-party memories.

Product quality

- Source-grounded answer rate
- Unsupported-claim and material-misattribution rate
- "Not recorded" precision and recall
- Subject-rated voice/style fidelity
- Family-rated emotional appropriateness
- Export completeness and restoration test success

Business

- Paid activation, capture completion, and time to first trusted answer
- Memories approved per profile
- Family invitations and activated relatives
- Core vs. concierge mix
- CAC by channel, gross margin, payback, and renewal
- Partner activation and profiles per partner

Trust and safety

- Consent verification failures
- Unauthorized-access attempts
- Opt-outs, retirements, and family disputes
- Distress reports per 1,000 sessions
- High-risk topic refusals and escalation outcomes
- Synthetic-media leakage or impersonation incidents
- Time to export after a customer request

Do not use daily active users, session length, message count, or streak retention as primary success metrics.

15. Principal risks and responses

Risk	Early indicator	Response
Category feels "creepy"	Low landing conversion; negative interviews	Sell interactive oral history; use original recordings first; test voice as opt-in
Hallucinated memories	Unsupported claims in family tests	Retrieval-only MVP, citations, high refusal threshold, subject review, frozen Memorial Mode

Risk	Early indicator	Response
Emotional harm/dependency	Distress reports or compulsive sessions	Adult-only, transparent framing, no engagement loops, easy pause, advisory review
Family conflict	Competing edit/access requests	Prior steward instructions, multi-party dispute freeze, immutable originals, individual opt-out
Impersonation/fraud	Attempts to export arbitrary voice	No arbitrary TTS, in-app use, watermarking, rate limits, identity and liveness checks
Company failure	Churn driven by continuity fear	Open export, escrow, reserve, fixed terms, annual resilience report
Vendor dependence	Cost or policy changes	Vendor abstraction, portable media/metadata, multiple evaluated providers
DTC CAC too high	CAC above first-year gross profit	Shift toward estate planners, senior communities, insurers, and gifting/referrals
Users prefer archive to clone	Low conversation but strong capture value	Make oral-history archive a complete standalone product, not a failed funnel
Regulation fragments	Delayed state launches	Jurisdiction gating, conservative consent baseline, regional hosting, counsel-led expansion

16. First 90-day execution plan

Days 1-30

- Recruit a founding trio or confirm ownership of CEO, CTO, and product/trust functions
- Interview 50 target customers and 15 professionals
- Test three messages and three price points with real deposit requests
- Draft the product constitution and nonconsensual-clone prohibition
- Complete a first U.S./EU/Israel legal scoping memo and data-flow diagram
- Manually record five subjects and deliver a beautiful non-generative archive

Days 31-60

- Build consent, capture, transcription, review, memory graph, and source-grounded text prototype
- Onboard 10 paid concierge families
- Create a 500-question persona evaluation set, including adversarial and high-stakes prompts
- Form the clinical/ethics advisory group
- Select two model/voice vendors and design for replacement

Days 61-90

- Expand to 25-50 profiles
- Add export, access logs, family opt-in, retirement, and incident workflows
- Conduct privacy/security threat modeling and the first external review
- Measure willingness to pay, completion, invite rate, answer coverage, trust, and distress
- Make a go/no-go decision for voice cloning; do not start a face/avatar workstream unless customers clearly demand it

Day-90 investment gate

Proceed to a full private beta only if:

- At least 15 customers paid or placed meaningful deposits
- At least 70% completed 20 stories
- At least 60% invited family
- At least 80% said they trusted the archive enough to preserve it
- Factual grounding reached 98%+ in the controlled evaluation
- No severe safety or consent incident remained unresolved

If people love recording and browsing but reject the simulation, continue as a premium interactive oral-history company. That is a viable, lower-risk business and preserves the option to add a representation later.

17. Final strategic recommendation

The investable business is not "AI that makes someone live forever." It is **trusted infrastructure for preserving a person's stories, voice, values, and permissions across generations**.

Begin with an archive people are proud to create while alive. Make every answer verifiable. Give the represented person and every family member agency. Design company failure, model failure, family conflict, and retirement into the product from day one. Add synthetic voice only when it increases trust, and add a face only when evidence shows that it adds emotional value without increasing harm or rejection.

That path produces a valuable company even if society never accepts fully photorealistic postmortem avatars-and preserves the right to lead that market if it does.
